## About Me

I'm in my fourth year of college, and I just switched my major to Web and User Experience a little over a year ago. Before I was interested in becoming a graphic design student, but the coding world caught my eye. Since there is still a great deal of design in web development, I thought it would be a good mix of both worlds.

So far I find Javascript really interesting and mess around with it in my spare time. I also like using Bootstrap in my projects. I recently got introduced to React.js and find it very appealing to use in future projects if there is any functionality needed.

## Sushi Sensei

Sushi Sensei is a website for sushi and food lovers to make delicious sushi rolls. The website offers sushi roll recipes and in person lessons to both beginners and more experienced chefs in the kitchen.

### Problem Statement

Many sushi enthusiasts struggle to find easy to follow recipes or on site locations on how to make sushi. In addition, there is a lack of accessible and an easy way of learning how to make quality sushi in a fun and straightforward way

### Goal

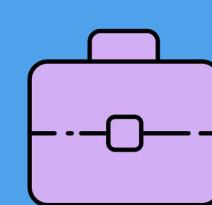

Have an accessible collection of step by step sushi instructions. Also, having a way to book in person sushi class on-site to fit people's schedules.

### Audience

Our audience is for all ages, especially those looking for the recipes. Ages 20 and above are encouraged to schedule in person classes to advance their skills. We aim to help anyone willing to learn even if it's just for fun because that will spark an interest. It is also for people who are health conscious and are looking for recipes to add to their repertoire.

### Page Connections

Everything is available from the homepage, there is a account person icon, or you can press the hamburger icon for the navigation menu in the mobile version. On the desktop There is just a nav bar with 5 nav buttons. The 404 page is available from the last 3 recipes since there is no content written for them, and also for the second recipe on the horizontal scroll on the homepage

# Project 1

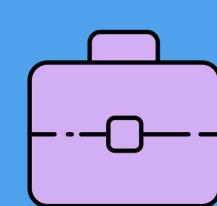

The screenshot shows the homepage of the Sushi Sensei website. At the top, there's a navigation bar with the logo "Sensei Sushi" and links for Home, Schedule, About Us, Browse Recipes, and Featured Recipe. Below the nav is a large image of a "New York Roll" (shrimp, cucumber, avocado) topped with sesame seeds. A small "Go to Recipe" button is visible in the bottom right corner of the image. Below the image, the name "New York Roll" is displayed in red, followed by a description: "Shrimp, Cucumber, Avocado". At the bottom left, it says "Sushi Sensei in Ogden" and features a logo of a sushi roll with a sun-like background.

Sushi Sensei Project

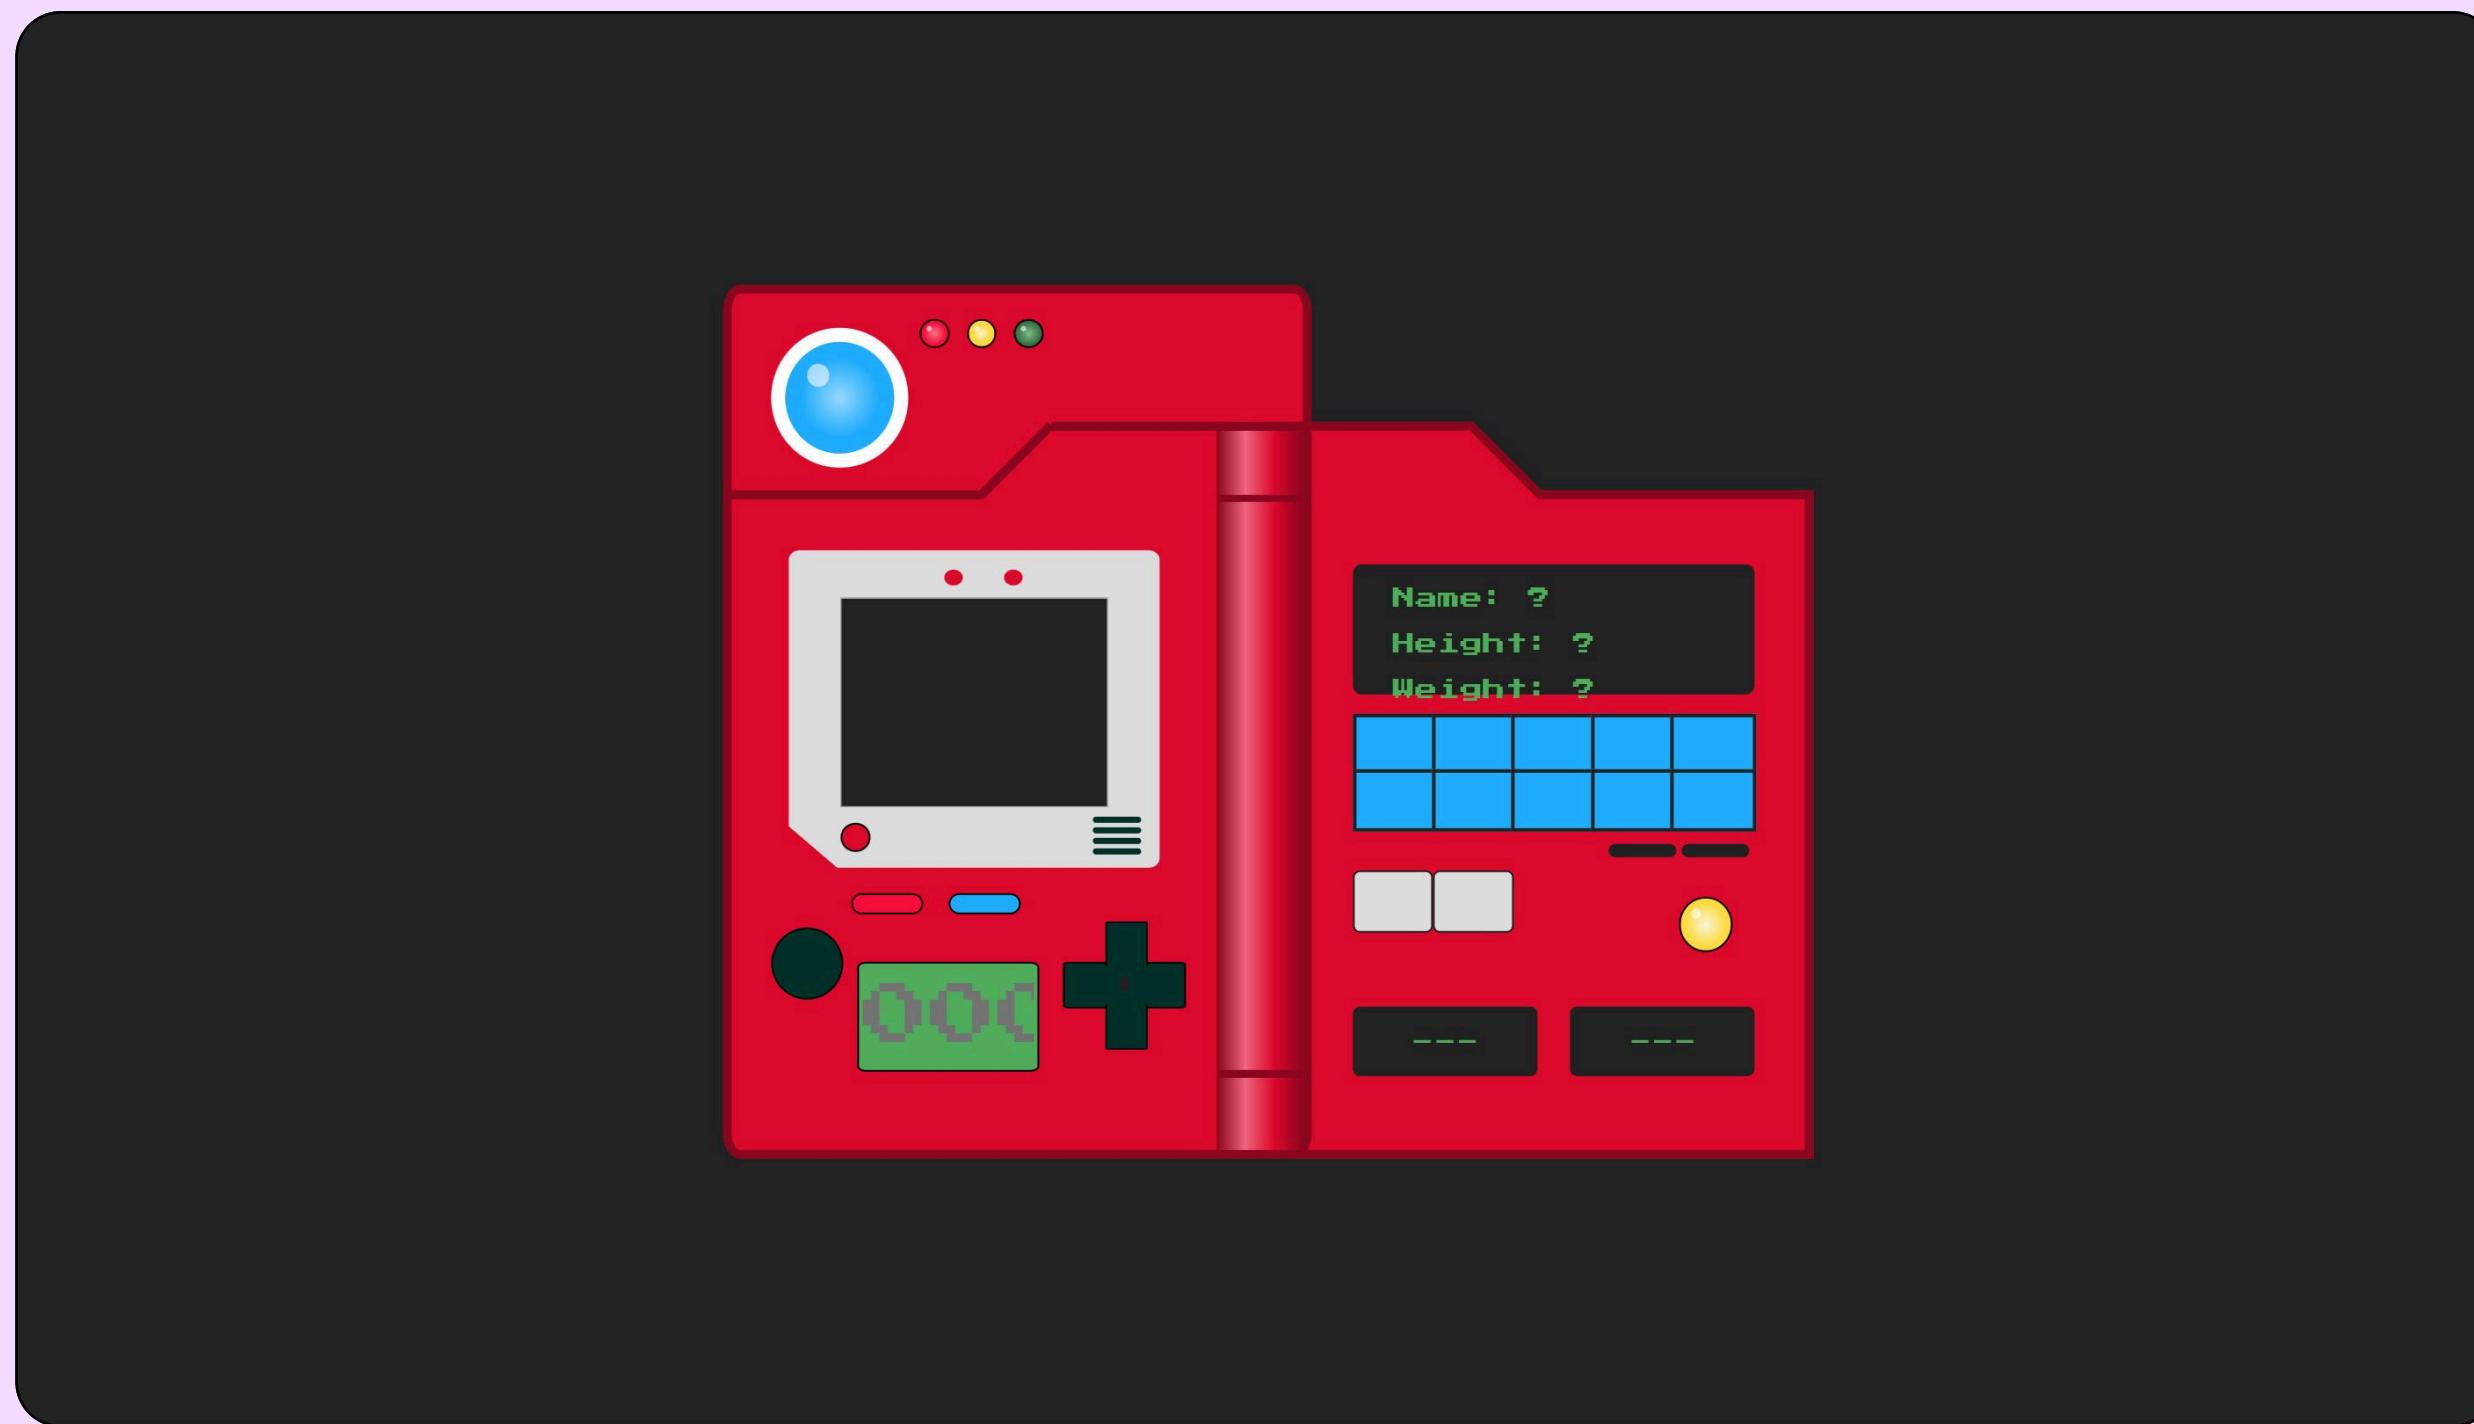

[Go to Project Site](#)

Bootstrap | scss

This project was the final for my WEB 2620 class. It was my idea to make a website designed to look like a sushi recipe and class sign up website. The user should be able to make appointments to take in person classes. There is also a featured recipe on the homepage with a link to take them to it. There is a page to browse all the recipes on the website and all of them except one take them to a customized 404 error page. There is a content page for one of the recipes with an actual recipe on how to make a roll. There is also a customized logo on the taskbar made in photoshop of a sushi roll in front of a sun. The website use some basic bootstrap, but the majority of it is just built with SCSS.

# Project 2

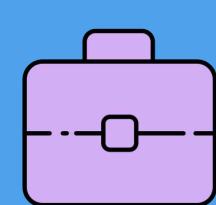

Pokedex API Project

[Go to Project Site](#)

Javascript

This is a JavaScript project that searches an Web API with information full of 1025 Pokemon. The user enters a number 1 to 1025 and then presses enter or the black circle to the left of the input box and then a list of information appears about the Pokemon searched along with an image. JavaScript works with the api to display the name, height, and picture of the Pokemon. The device is supposed to represent the Poke Dex from the Pokemon video game, where it has the same functionality.

# Project 3

Matching Game

A 4x4 grid of squares. The top-left square contains an '&'. The bottom-right square contains a '#'. There are also other empty and filled squares.

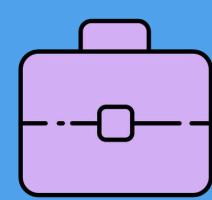

Flips: 16 | Matches: 2

Matching Game Project

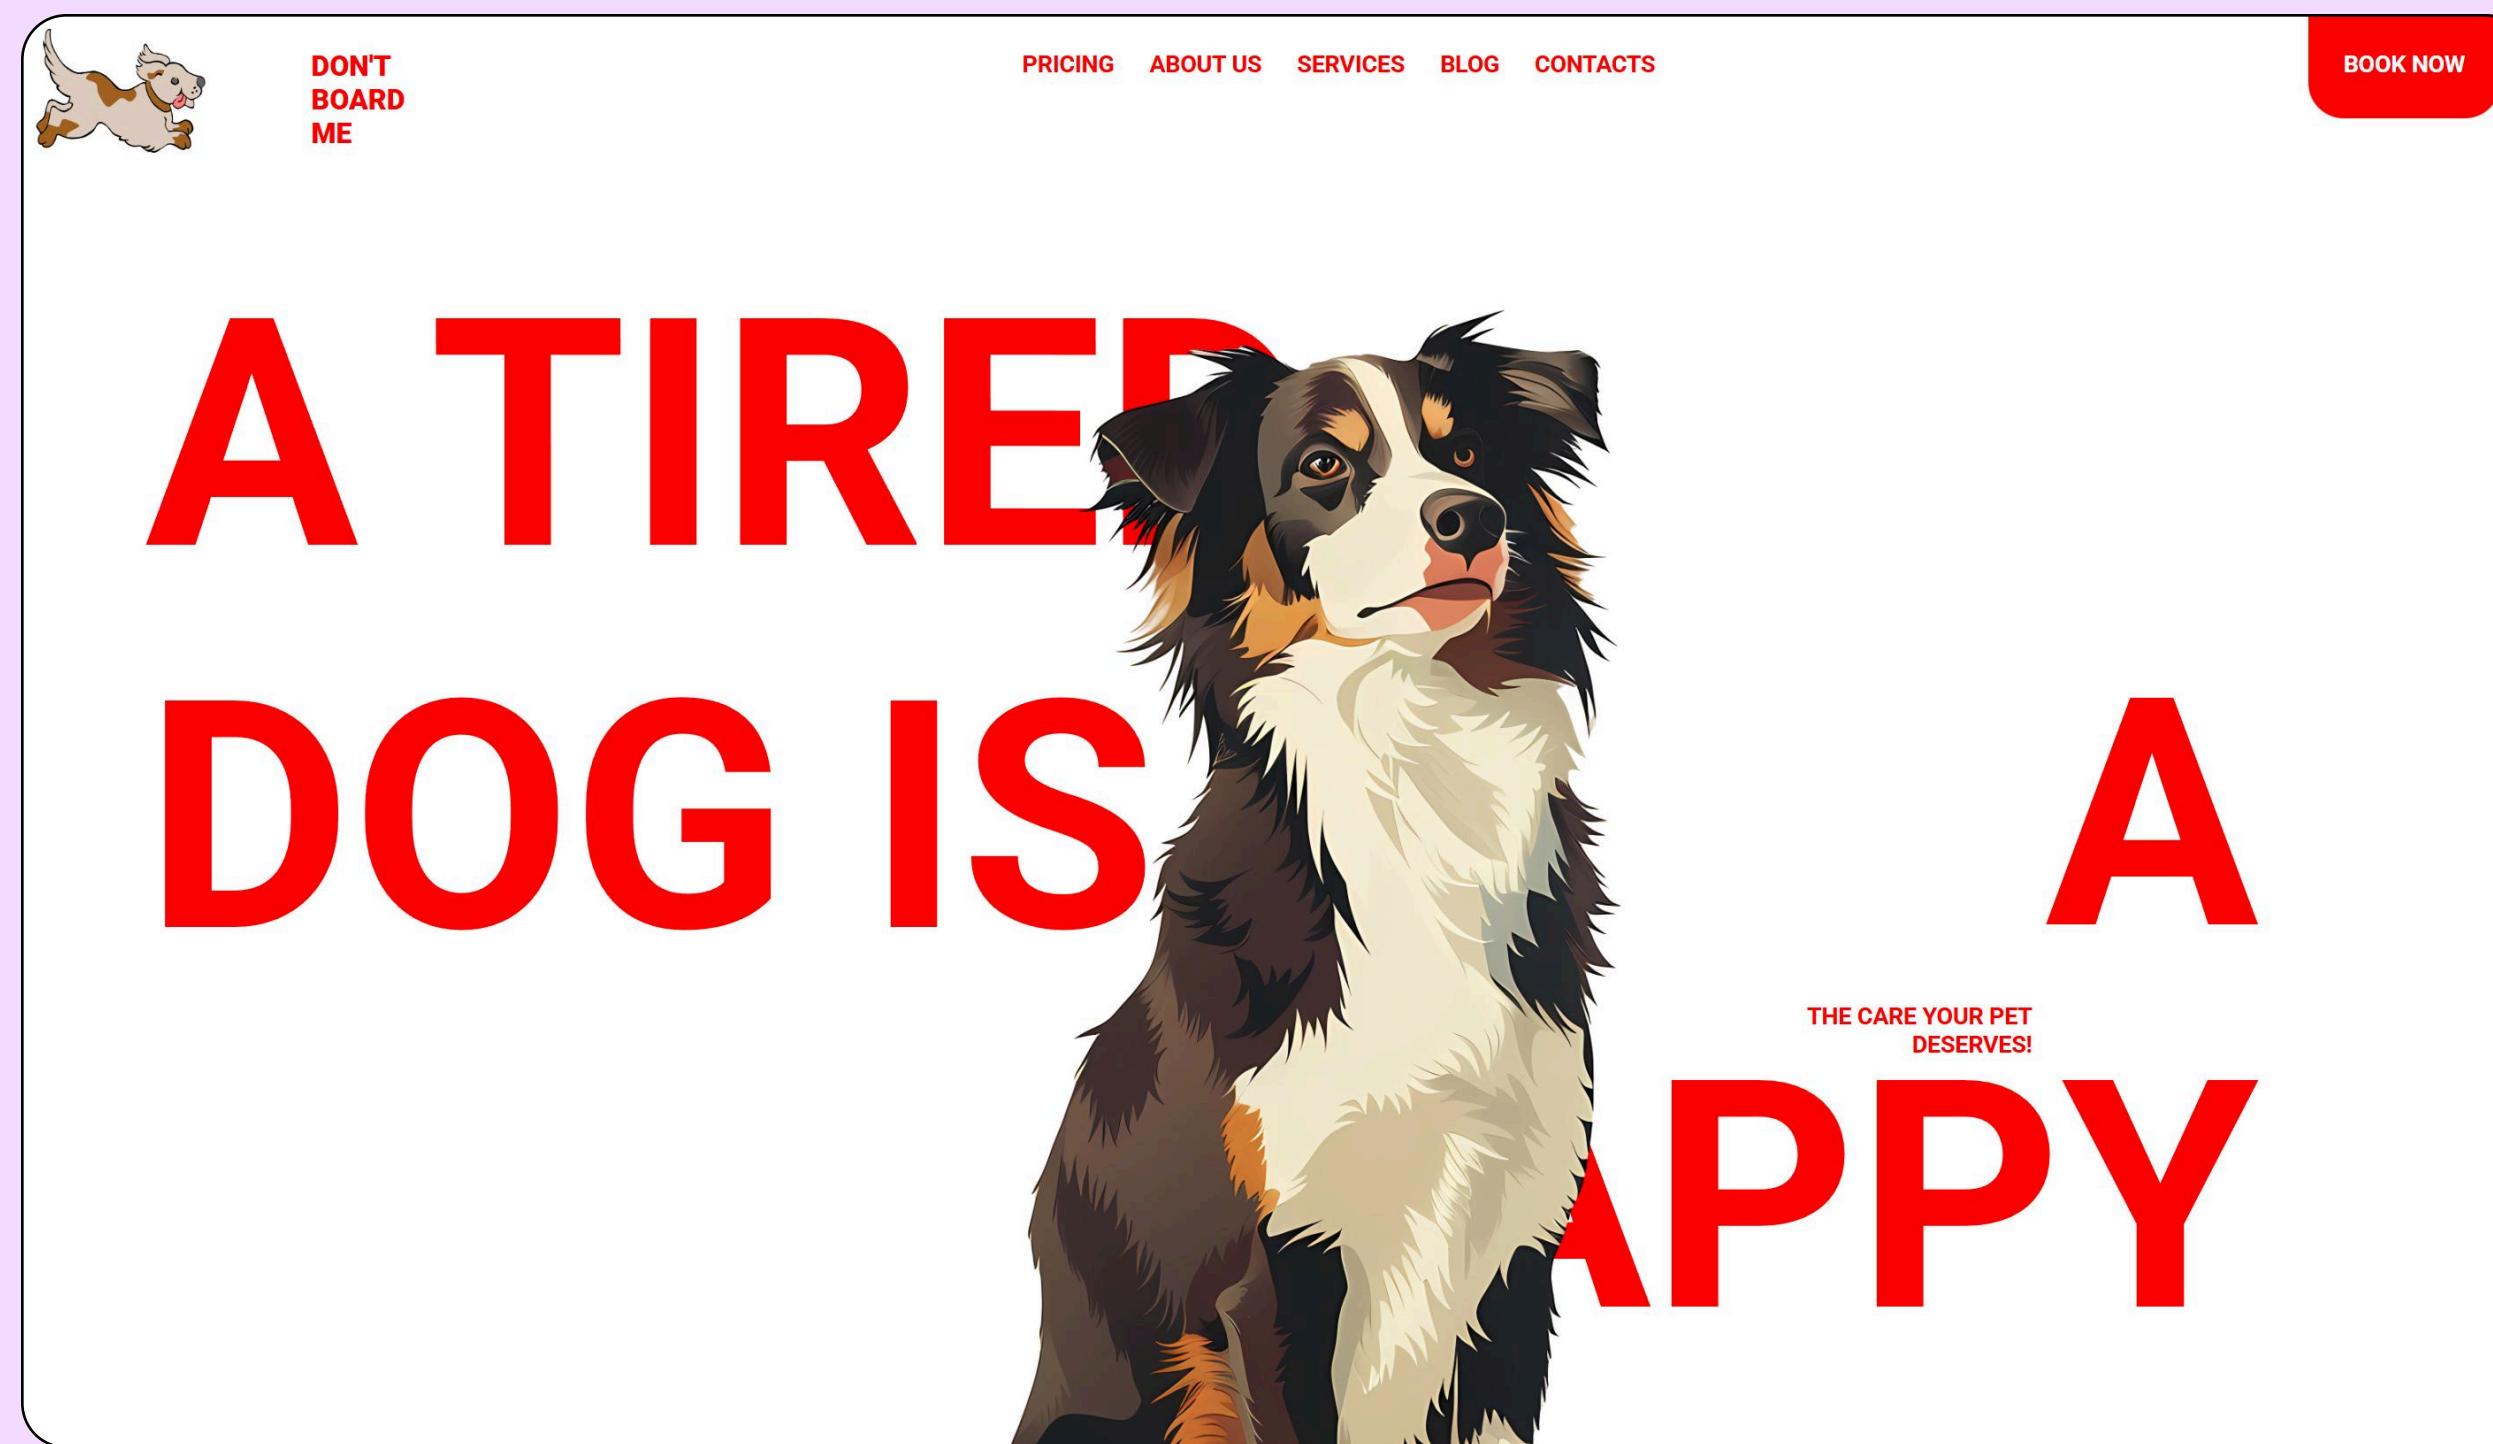

[Go to Project Site](#)

Javascript

This was my final for WEB 1400. It is a matching game where the user matches the special characters with each other, and they also choose how many matches from 2 to 8 they play with. When the mouse clicks a grey box the symbol will be show for about three seconds along with a second one for the user to try and make a pair. When the user does make a correct pairing they paired symbols will stay flipped and a counter for flips and matches is held at the bottom. When all matches are made an alert will signify that the user has completed the game and how many flips it took. Once the alert okay button is pressed the game will restart for the user to plays again.

# Project 4

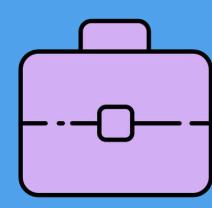

Dog Boarding Project

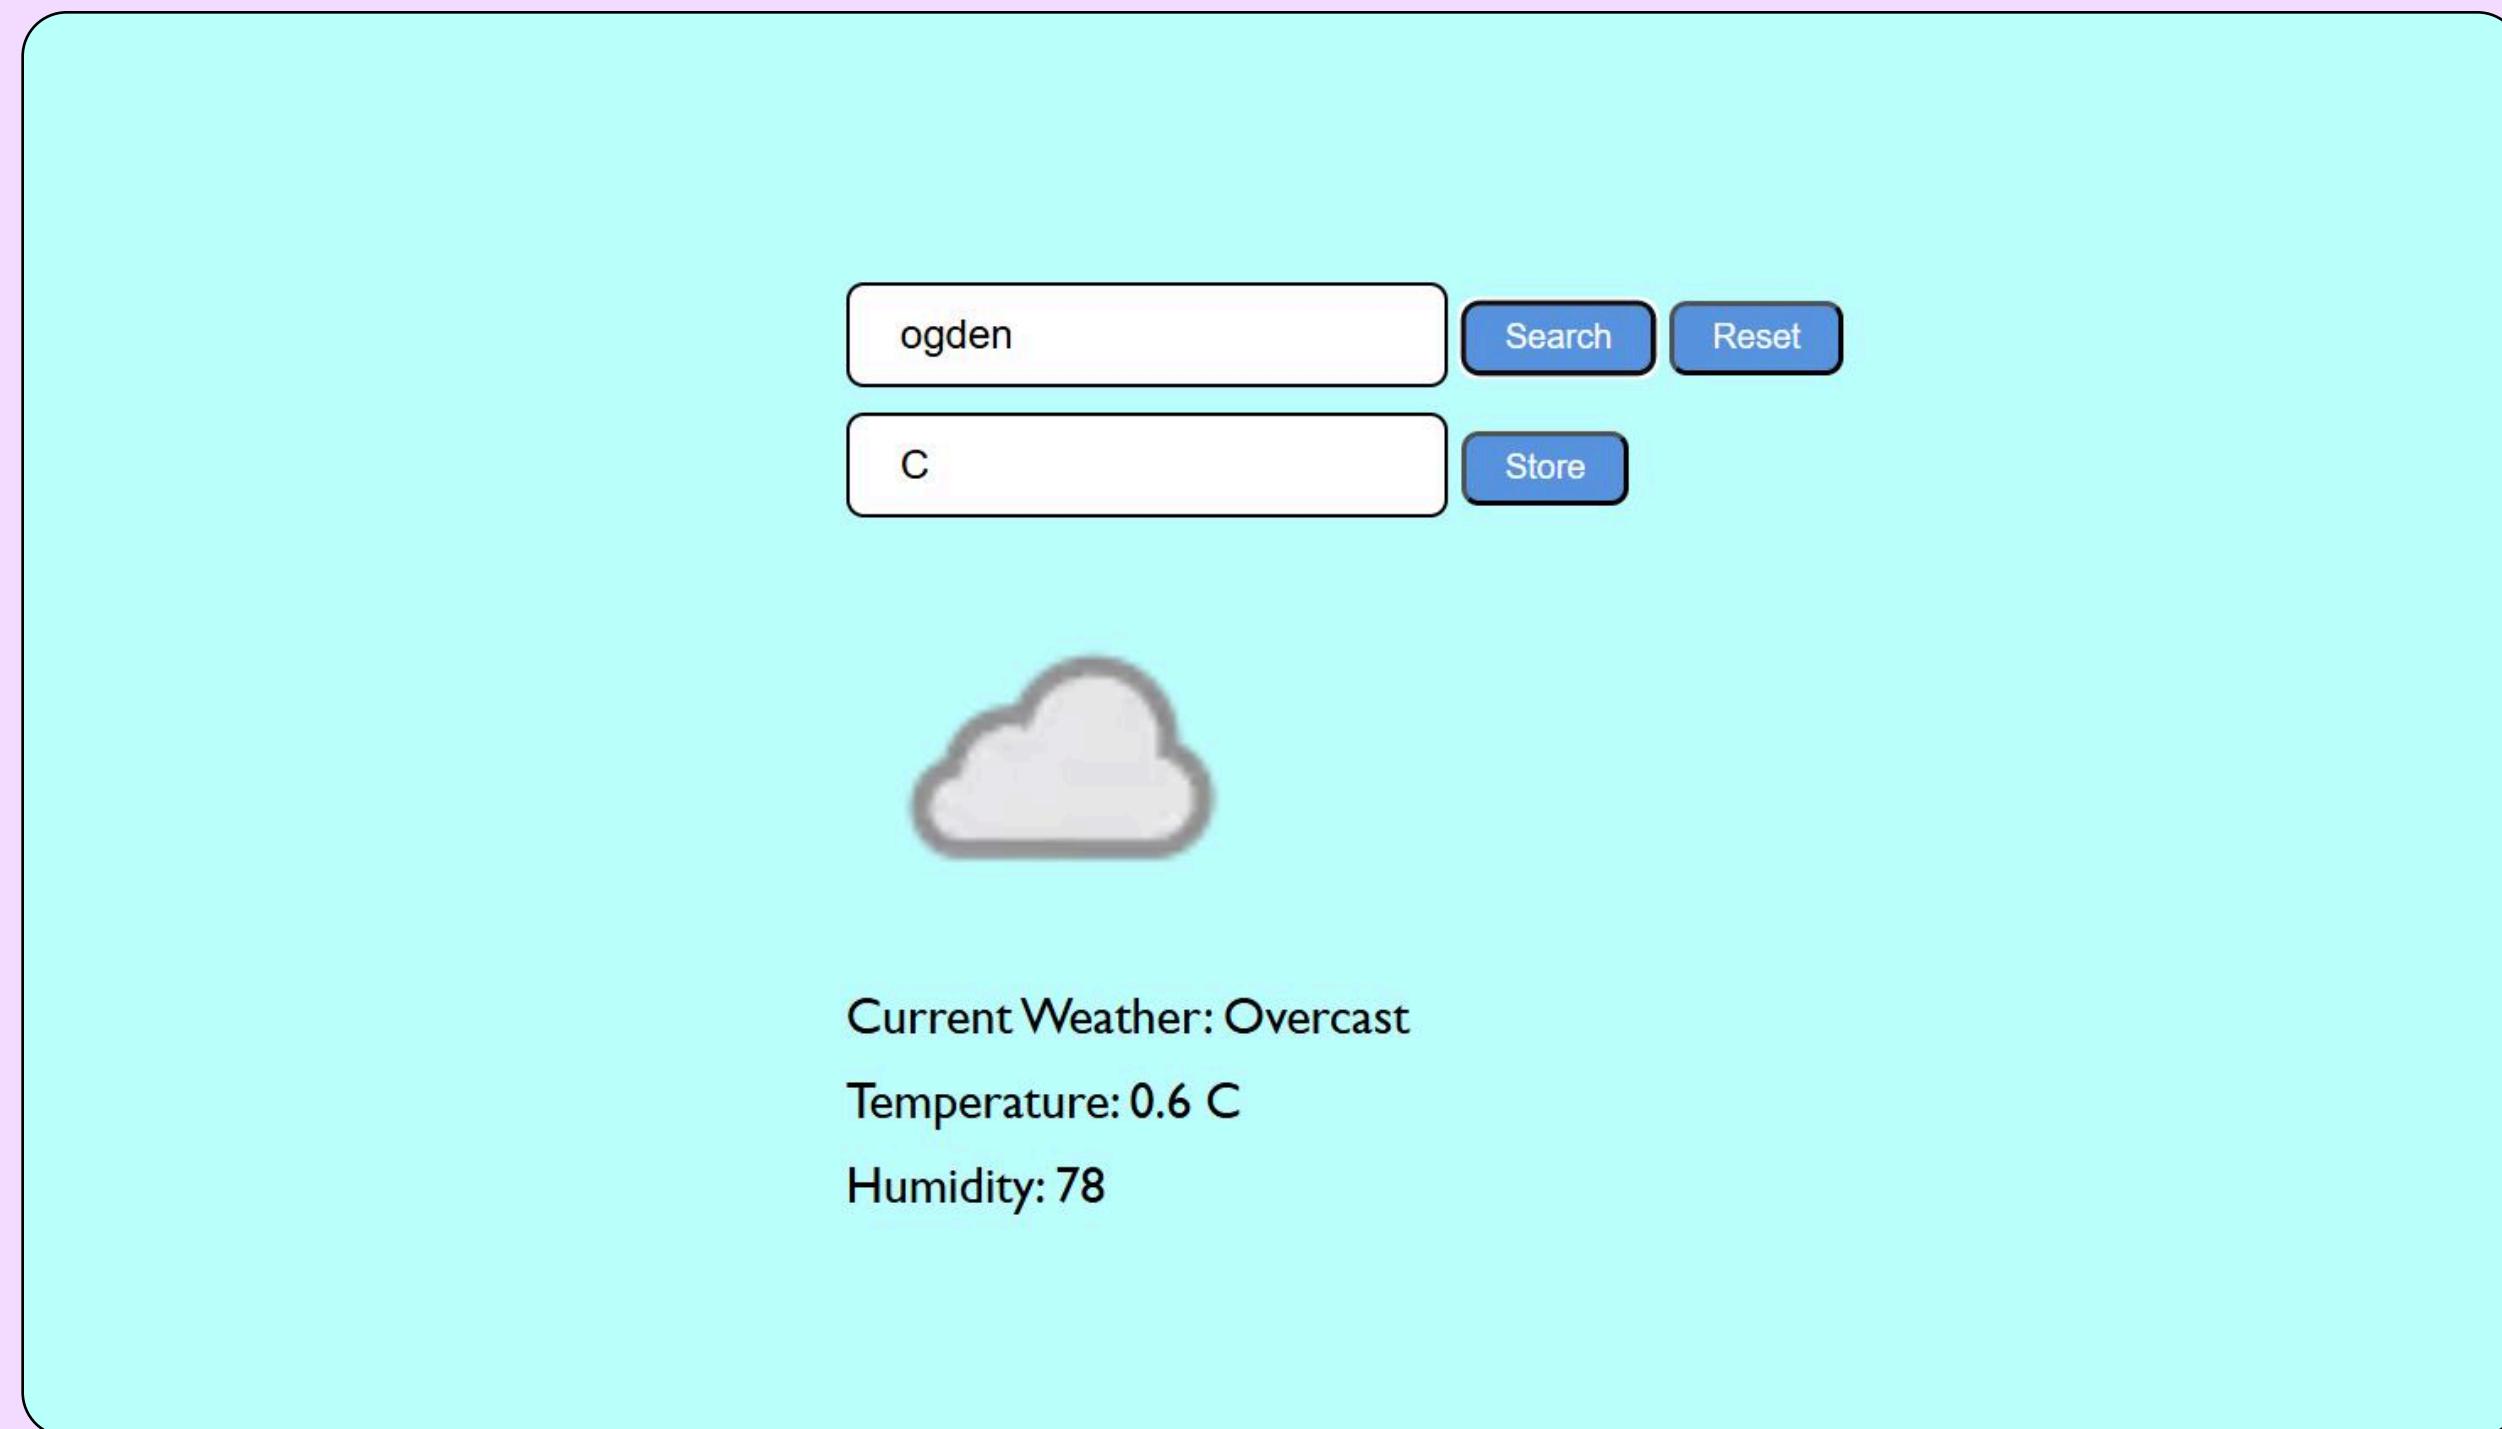

[Go to Project Site](#)

css

This CSS project was one of my first projects I did in WEB 1400 to practice how place objects correctly to create a design. The point of the website is to promote a service where people can leave their dogs with other dog lovers who will take care of them and not have to leave their pets in pet boarding. It taught me basic structure and organization of where buttons, elements, and images should go on a website.

# Project 5

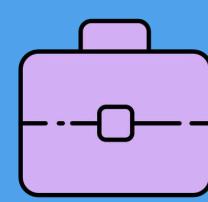

Weather API Project

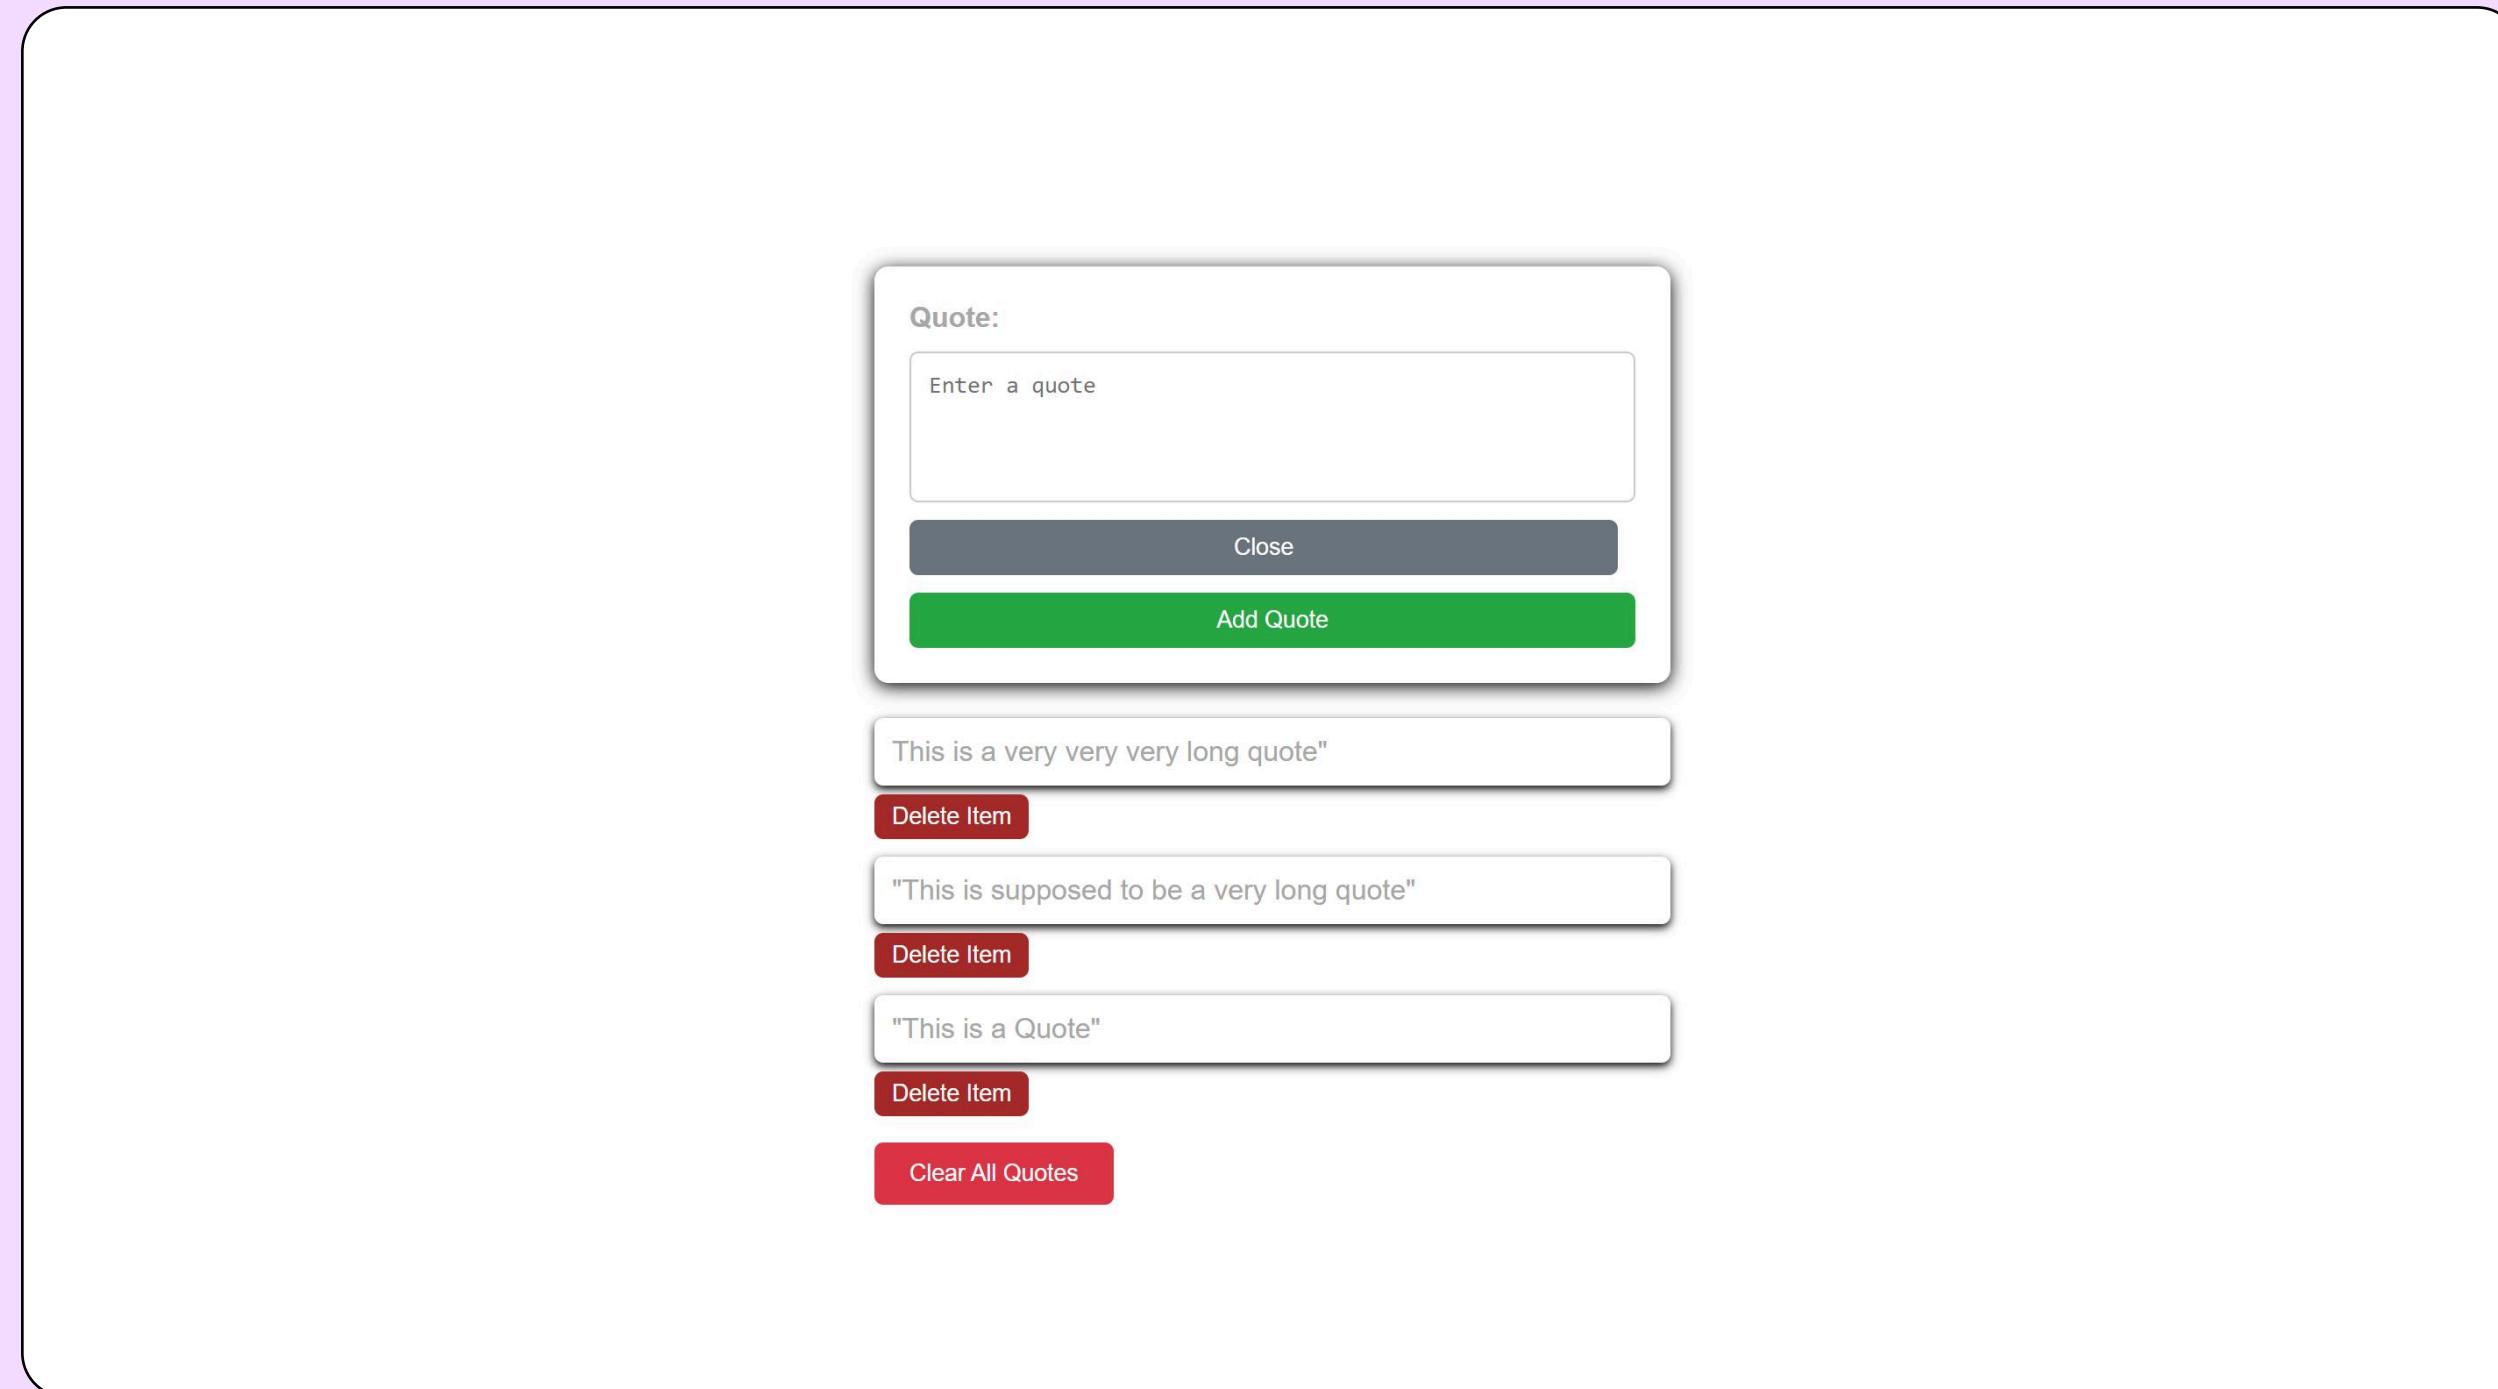

[Go to Project Site](#)

Javascript

This project uses a global weather API. The user searches a location and the JavaScript pulls the information on that location's current weather and displays that information. A symbol like a cloud or sun will appear along with the weather, temperature, and humidity. There is a second input that stores a c or f for Fahrenheit or Celsius and when it is stored the temperature will change to whichever is selected.

# Project 6

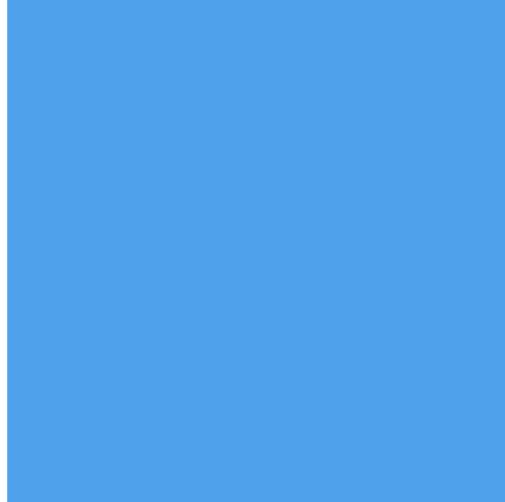

## Quote List Project

[Go to Project Site](#)

Javscript | React

This project uses React JS framework and is one of the first projects I made in my WEB 3350 Class that I'm currently in. This web application lets the user open the form with the a button and it appears. The user enters a quote and it is added to a list of quotes. The quotes in the list each have a delete item that deletes the individual quote from the list and there is also a clear all button to clear the whole list.
